OM protein - protein search, using sw model

Run on: April 23, 2003, 18:04:50 ; Search time 13 Seconds (without alignments)

427.525 Million cell updates/sec

Perfect score: 711
Sequence: US-09-142-524D-3
Sequence: 1 MKVTVAFNQFGFNRRVFIKR......KFIRRVDGIIAAYQNPASWK 134

Scoring table: BLOSUM62
Gapop 10.0 , Gapext 0.5

Searched: 112892 seqs, 41476328 residues

Total number of hits satisfying chosen parameters: 112892

Minimum DB seq length: 0
Maximum DB seq length: 200000000

Post-processing: Minimum Match 100%
Maximum Match 100%
Misting first 45 summaries

Database: SwissProt_40:*

                                                                                                                                                                                                                                                                                                                                                          SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: PREDOMINANTLY FOUND IN THE PISTIL WHERE IT FOUND IN THE OFFER FIVE LAYERS OF THE STRANDS OF TRANSMITTING TOUND IN THE OUTER FIVE LAYERS OF THE STYLE. FOUND AT MUCH TISSUE WITHIN THE UPPER TWO-THIRDS OF THE STYLE. FOUND AT MUCH LOWER LEVELS IN THE ANTHERS AND VEGETATIVE ORGANS.

LOWER LEVELS IN THE ANTHERS AND VEGETATIVE ORGANS.

DEVELOPMENTAL STAGE: MAXIMUM LEVELS ARE FOUND DUTRING ANTHESIS.
SIMILARITY: 54% IDENTICAL TO TOMATO PROTEINS P59 (AC P15722)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AAW27371;

Multi-epitope peptide used as immunotherapeutic agent #3

24-MAR-1998 (first entry)

```
DT PT XXX PAX PT XXX PX
          Peptide immuno:therapeutic agent to treat allergic diseases contains multi-epitope peptide containing {\tt T} cell epitope regions from different allergens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Multi-epitope peptide; immunotherapeutic agent; allergic disease; T-ceil epitope region; allergen; lymphocyte; immunoglobulin E.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a new immunotherapeutic agent. It comprises T cell epitope regions from 2 or more different allergens (preferably linked via arginine or lysine dimers), where the T cell epitope regions: have a positivity index greater than 100 as measured in a patient group responding to the allergen; have at least 70% reactivity with lymphocytes from patients responding to the allergen; and are not reactive with immunoglobulin E (IgE) antibodies from patients responding to the allergen; and are not reactive with immunoglobulin be used to prevent and treat a wide variety of allergic diseases, e.g. by desensitisation. Side effects, e.g. those mediated by IgE, are reduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a multi-epitope peptide which is used as a new immunotherapeutic agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            responding to the allergen; and are not reactive with immunoglobulin (IgB) antibodies from patients responsive to the allergen. The agent be used to prevent and treat a wide variety of allergic diseases, e.g desensitisation. Side effects, e.g. those mediated by IgE, are reduced.
                      The present sequence represents a multi-epitope peptide which is used as a new immunotherapeutic agent. It comprises T cell epitope regions from 2 or more different allergens (preferably linked via arginine or lysine dimers), where the T cell epitope regions: have a positivity index greater than 100 as measured in a patient group responding to the allergen; have at least 70% reactivity with lymphocytes from patients responding to the allergen; and are not reactive with immunoglobulin E (IgE) antibodies from patients responsive to the allergen. The agent can be used to prevent and treat a wide variety of allergic diseases, e.g. by desensitisation. Side effects, e.g. those mediated by IgE, are reduced.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method of desensitizing a patient to a C polypeptide allergen and comprises administering to the patient a peptide conditions of the patient and comprises administering to the patient a peptide consessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who consistising patients to allergens present in e.g. grass, tree and weed (including ragweed) pollens, fungi and moulds, foods, stinging insects, concluding ragweed) pollens, fungi and moulds, foods, stinging insects, concluding midge (non-biting midges), spiders and mites, housefly, fruit for sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence

RNA was prepd. and used to synthesise cDNA. The cDNA was subjected to successive rounds of PCR to yield a full length Cry j I clone. Cry j I or an antigenic fragment of it may be used for detecting, treating and preventing an allergic response to Japanese cedar pollen allergen. It is capable of modifying both the B and T cell response to Cry j I and T cell response

Peptide antigens derived from it can be used for the treatment and diagnosis of allergies associated with Japanese cedar pollen. The peptides have enhanced therapeutic properties but reduced side effects compared to naturally occurring allergens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                         preformulation scheme to develop an optimised drug product for therapeutic treatment of humans suffering from allergy to Japanese cedar pollen allergen or an allergen which is immunologically cross reactive with Japanese cedar pollen allergen. Such modified peptides possess certain characteristics which render them particularly suitable for drug product formulation. Peptide fragments of Cry j I, modified and unmodified, are given in AAR82491-R82525.

This invention describes a novel method of desensitizing a patient to a CC polypeptide allergen and comprises administering to the patient a peptide CC derived from the allergen where restriction to a MHC Class II molecule CC possessed by the patient can be demonstrated for the peptide and the CC peptide is able to induce a late phase response in an individual who consistising patients to allergens present in e.g. grass, tree and weed cf. (including ragweed) pollens, fungi and moulds, foods, stinging insects, cc. (including ragweed) pollens, fungi and moulds, foods, stinging insects, cc. fly, sheep blow fly, screw worm fly, grain weevil, silkworm, honeybee, cc. mon-biting midge larvae, bee moth larvae, mealworm, cockroach, larvae of the produce immunological vaccines which may be used to prevent and/or treat cc. conditions involving hypersensitivity to allergens. This sequence cc. represents a cedar (Cedrus sp.) allergen 493632 Cry j JA.

The methods can be used for CC possesses the MHC Class II molecule. The methods can be used for CC desensitising patients to allergens present in e.g. grass, tree and weed CC including ragweed) pollens, fungi and moulds, foods, stinging insects, CC the chiromidae (non-biting midges), spiders and mittes, housefly, fruit CC fly, sheep blow fly, soriew worm fly, grain weevil, silkworm, homeybee, CC non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvae of Tenibrio molitor beetle, mammals such as cat, dog, horse, cow, pig, CC sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat CC conditions involving hypersensitivity to allergens. This sequence CC represents a japanese cedar (Cedrus sp.) allergen 541802 Cry j I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a peptide, its complex, derivative or its polymerizate, where the peptide (I) has a formula of: alpha1-alpha2-alpha3-alpha4-alpha5-alpha6-alpha7 alpha1 to alpha7 = amino acid sequence selected from amino acid sequences ranging from 11-19 amino acids derived from T cell epitopes derived from cedar (japanese cedar - Cryptomeria japonica) pollen allergens. The peptide can be used in an antisugipollinosis agent. AAF59011 to AAF59062 and AAB69094 to AAB69121 represent sequences used in the exemplification of the present invention.
